## Series 34 - Extension of the successful LED navigation lights

aqua signal has extended its successful Series 34 LED navigation light range for sailing and motor boats up to 50 metres in length. From now on the LED navigation light is also available as All-round, Masthead and Tricolour version - either as single or combination light for Masthead mounting.

All versions are available with black or white housing and equipped with aqua signal's well proven quicfits system. The dimensions of the Series 34 match those of the conventional Series 32 lights and facilitate therefore the replacement of conventional navigation lights to innovative LED technology.

The new models delight their users with their slim design and low weight, as well as a particularly long service life. All versions have the internationally recognised wheelmark certification.

## Series 30 - The latest generation of LED navigation lights

Specially designed for motor boats, the latest LED light series 30 is characterised by its easy installation.

The housing made of black polycarbonate is seawater resistant, non-corrosive and non-magnetic, impact and shock resistant.

A special highlight is the EMC tested and interference-free LED electronics developed by aqua signal which is used at all aqua signal navigation lights. This technology ensures an interference-free operation of radio equipment (especially distress frequencies) and GPS systems.

The All-round white Series 30 navigation light as pedestal (BSH approved), fold down and plug-in version will be available early September.

**If you need further information, please do not hesitate to contact us. We look forward to hearing from you!**
